Who is talking to you?

- 36 years
- Studied PPRE in 2012 – 2014
- Worked at Enercon as wind measurement engineer 6 years
- Working at Energy Meteorology team at DLR Oldenburg
- Since 10 years volunteering at the Olegeno
- Since 5 years in the board of directors

Olegeno PV plants

- Solarbrüter 2005: 1.1
- Feuerwache 2019: 40
- Kreyenstraße 2020: 46.7
- Monopoly 2022: 0.2
- Guntrud-H.-Str 2024 49
- Quartiersgarage 2024? 175
- Total: 312 kWp
- + many balcony pv modules

Solution:

- Create your own dashboard.
- Problem:
 - Different softwares and APIs for each inverter
 - You always need direct LAN connection for free access.

Concept

1. Step: Olegeno Wireguard VPN

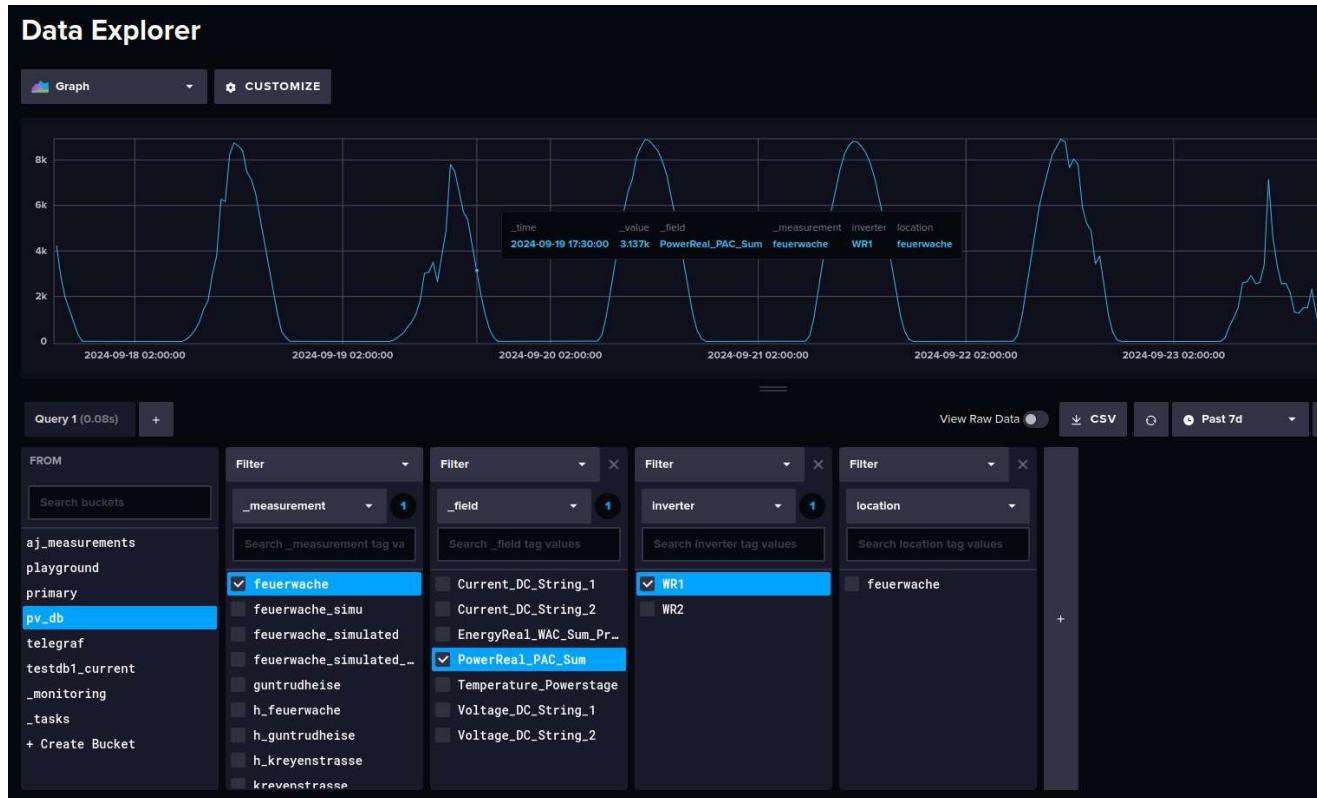

- 4G Router with VPN possibilities (also used for direct access for marketeers)

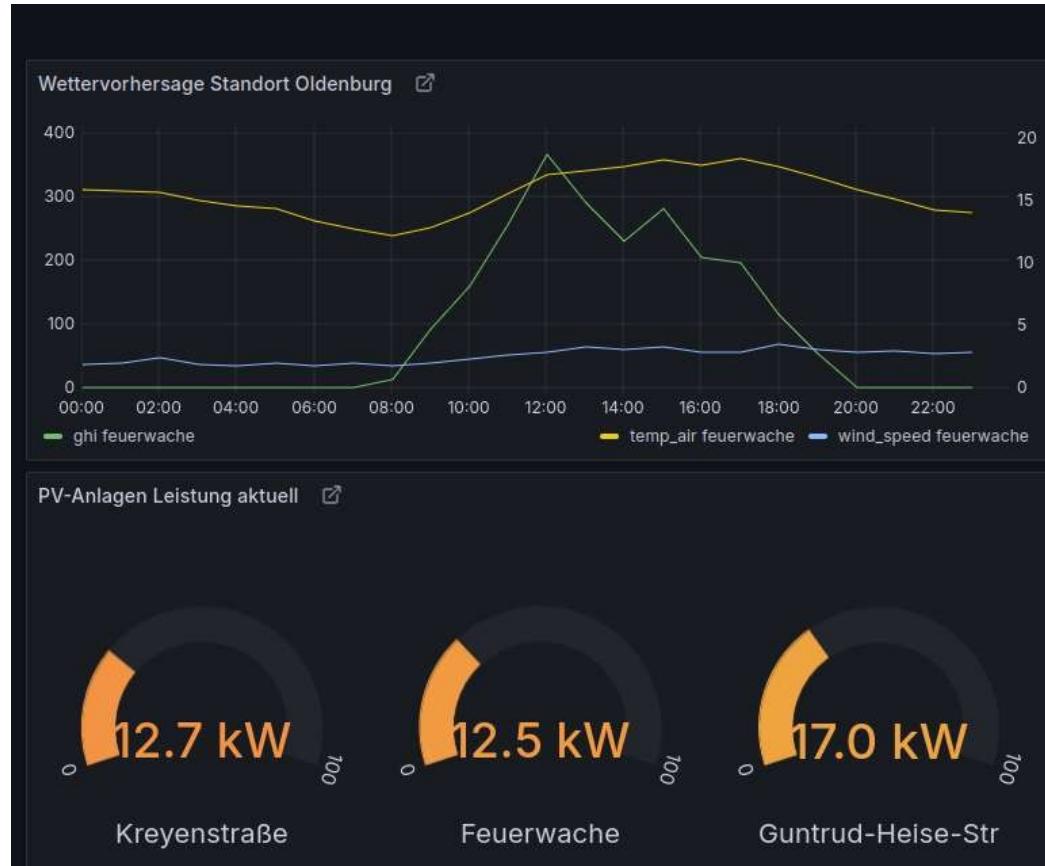

2. Step Python Importers

- Check influxdb for existing data
- Request missing data from inverter
- Send to influxdb
- One importer per plant

3. Step: InfluxDB

4. Step: Visualization in Grafana

Demonstration Grafana

- See specific power of pv plants
- Guntrud-Heise-Straße with Battery
- Weather forecast Feuerwache
- PV Simulation Feuerwache

New Ideas?

- Simulation for all plants with python pvlib
- Queries for automatic business evaluation
- Calculate long-term performance ratios of pv plants

Performance Ratio from pvlib modelling

$$\text{Performance Ratio (PR)} = \frac{Y_f}{Y_r}$$

Final Yield (Y_f) = $\frac{\text{Final Energy Output (kWh)}}{\text{Nominal d. c power (kW)}}$

Reference Yield (Y_r) = $\frac{\text{Total in-plane irradiance (kWh/m}^2\text{)}}{\text{PV reference irradiance (kW/m}^2\text{)}}$

Your ideas?

- Send them to stuehrenberg@olegeno.de
